

PERSONAL LIFE OS

Product Development Plan & UI/UX Specification

Purpose: A cross-platform personal operating system that brings money, productivity, habits, goals, time, wellness, knowledge, analytics and AI assistance into one coherent experience.
Primary design requirement: Mobile-first, responsive and PWA-ready. The same product must work naturally on phone, tablet and desktop without feeling like a desktop application squeezed onto a small screen.

Prepared as a product blueprint for UI design, engineering planning and phased development.

1. Product Vision

Build a **Personal Operating System**, not a collection of disconnected utilities. The application should help a person understand what they planned, what they actually did, where their time and money went, and whether daily actions are moving them toward their goals.

Core product loop: Capture → Organize → Act → Track → Reflect → Improve.

- **Capture:** Quickly record expenses, tasks, habits, notes, events, health data and ideas.
- **Organize:** Connect records to projects, categories, goals, time and people/context.
- **Act:** Provide a clear Today experience with the few actions that matter now.
- **Track:** Show progress without requiring users to inspect multiple modules.
- **Reflect:** Daily/weekly/monthly reviews identify patterns and unfinished commitments.
- **Improve:** AI suggests practical next actions based on the user's own data.

Product principle: **the user should never need to understand the internal data model to use the app.** Complexity belongs behind the interface.

2. Target User & UX Principles

Principle	Requirement
Fast capture	Most common actions should take 1–3 taps or a single natural-language/voice command.
Today first	The home screen answers: What matters today? What is overdue? What changed?
Progressive disclosure	Show essential information first; advanced filters, analytics and settings appear on demand.
Cross-device continuity	Responsive layouts, installable PWA, touch-friendly controls and keyboard shortcuts on desktop.
Low cognitive load	Avoid dashboards packed with cards. Use hierarchy, whitespace and clear states.
Accessible	Readable typography, strong contrast, 44px+ touch targets, semantic controls and reduced-motion support.
Trust	Every AI action must be reviewable and reversible. Financial and health records should show clear provenance.

3. Information Architecture

Recommended primary navigation:

Navigation	Purpose
Today	Unified daily command center: tasks, habits, schedule, money snapshot, wellness and priorities.
Tasks	Tasks, projects, recurring work, inbox and planning.
Goals	Goals, milestones, progress and linked habits/projects.
Money	Expenses, income, budgets, bills, subscriptions and financial overview.
Calendar	Events, time blocks, appointments and time insights.
Wellness	Sleep, movement, water, mood, energy and optional health integrations.
Notes	Notes, journal, ideas, knowledge and search.
Insights	Life analytics, trends, correlations and reviews.
AI	Natural-language assistant, capture, planning and analysis.

Mobile navigation: bottom navigation with 4–5 primary destinations plus a prominent Quick Add button. Secondary modules live in a More/Command surface. **Tablet:** navigation rail + adaptive two-column layouts. **Desktop:** persistent

sidebar + command/search bar + multi-column workspace.

4. Module Specifications

Money & Finance

- Expense capture: amount, category, account, payment method, date/time, merchant, notes, tags and receipt attachment.
- Income tracking, transfers, recurring transactions, budgets, bills, subscriptions and savings targets.
- Monthly cash-flow view, category spending, budget progress, recurring commitments and net-worth snapshot.
- Smart behavior: recognize recurring expenses, detect unusual spending and allow natural-language entry such as 'Spent ■450 on dinner'.
- Design priority: fast entry and excellent mobile experience; detailed analytics can expand on tablet/desktop.

Tasks & Productivity

- Task inbox, today, upcoming, overdue, recurring tasks, subtasks, priorities, tags and projects.
- Support due date, scheduled date, estimated duration, effort, dependencies and completion history.
- Views: list, board, calendar/time-block and project view. Keep one default simple view.
- Tasks can be linked to goals, habits, notes and calendar events.
- Include quick capture and an optional focus mode showing one task at a time.

Habits

- Binary and measurable habits: yes/no, count, duration, quantity or target value.
- Schedules: daily, selected weekdays, weekly target and flexible frequency.
- Show consistency, completion rate, current/best streak and trend over time.
- Allow habits to contribute evidence toward goals without forcing every goal to be a habit.
- Use gentle recovery UX: missed days should not create guilt-heavy UI.

Goals

- Goal → milestone → project/task structure.
- Goal types: numeric target, milestone-based, habit-supported and date-based.
- Progress calculation should be transparent and editable.
- Show next action, recent progress, blockers and linked tasks/habits.
- Support short-, medium- and long-term goals with review dates.

Calendar & Time

- Events, appointments, recurring events, reminders and time blocks.
- Optional time tracking for work, study, exercise, travel, entertainment and custom categories.
- Daily/weekly timeline with task scheduling and conflict visibility.
- Time insights: planned vs actual, focus time, fragmented time and category distribution.
- Integration-ready architecture for external calendars later.

Health & Wellness

- Keep the initial scope lifestyle-oriented: sleep, steps/activity, water, exercise, weight, mood, energy and stress.
- Daily wellness check-in should take seconds.
- Trend views should correlate wellness signals with productivity, habits and goals without making medical claims.

- Prepare an integration layer for Apple Health/Health Connect/wearables in a later phase.
- Use privacy-first controls and make sensitive data visibility explicit.

Notes / Journal / Second Brain

- Quick notes, structured notes, daily journal, ideas, checklists and knowledge pages.
- Rich text, tags, folders/collections, backlinks and attachments as the product matures.
- Daily journal can be generated from the user's timeline, but must be editable and clearly marked as AI-generated.
- Global search should cover notes and eventually tasks, expenses, goals and events.
- Create a unified timeline/search experience rather than separate silos.

Life Analytics

- Daily, weekly and monthly review dashboards.
- Metrics: task completion, habit consistency, goal progress, spending, time allocation, wellness trends and learning/personal metrics if added later.
- Focus on trends and relationships rather than a single 'life score'.
- Examples: spending vs budget, planned vs completed work, sleep vs productivity, exercise vs mood.
- Every insight should explain the underlying data and time period.

AI Personal Assistant

- Natural-language capture: expense, task, reminder, note, event or journal entry.
- Ask questions: 'What did I accomplish this week?', 'How much did I spend on food?', 'What goals are slipping?'
- Planning: break goals into milestones/tasks, create schedules and propose realistic next actions.
- Daily/weekly review: summarize what happened and highlight unfinished or changing priorities.
- Action confirmation: AI must preview consequential changes before applying them. Never silently modify financial/health records.
- Maintain an activity log showing AI-created or AI-edited records.

5. Cross-Module Data Model

The differentiator should be the relationships between modules. Recommended core entities:

Entity	Relationships
User	Owns all personal data and preferences.
Task	Belongs to project; can link to goal, note, event and habit context.
Project	Groups tasks and can contribute to a goal.
Goal	Contains milestones and links to projects/tasks/habits.
Habit	Has schedule, target and completion records; may support a goal.
Expense	Belongs to category/account; can be recurring and budget-linked.
Budget	Defines target by period/category and links to expenses.
Event	Lives on calendar; may link to task/project/goal.
Time Entry	Records actual time against a category/task/project.
Wellness Entry	Stores daily measurements/check-ins.
Note/Journal Entry	Can link to any entity and appear in timeline/search.

Entity	Relationships
Insight	Stores the calculation/source period and explanation.
AI Action	Stores request, proposed change, approval state and affected records.

Universal metadata: created_at, updated_at, archived_at, tags, source, attachments and audit information where appropriate. Design APIs so modules can reference one another without hard coupling.

6. The Most Important Screen: Today

The home screen should be an adaptive daily command center, not a generic analytics dashboard.

- **Header:** date, greeting, search/command entry and profile/settings.
- **Top priority:** 1–3 important tasks or commitments.
- **Timeline:** upcoming calendar items and scheduled work.
- **Habits:** today's habit checklist with compact progress.
- **Money:** today's spend + monthly budget status, compactly displayed.
- **Wellness:** quick status for sleep/activity/mood/water if enabled.
- **Goal pulse:** one or two goals needing attention.
- **AI briefing:** optional short summary and suggested next action.
- **Quick Add:** always accessible for expense/task/habit/note/event/health entry.

Allow users to reorder or hide Today sections. Personalization is more important than forcing one dashboard layout.

7. Responsive & PWA Design System

Device	Recommended UX
Mobile 320–767px	Single-column layouts, bottom nav, full-screen forms/sheets, sticky Quick Add, swipe actions.
Tablet 768–1199px	Navigation rail, two-column dashboards, split-view editing where useful.
Desktop 1200px+	Persistent sidebar, multi-column workspace, keyboard shortcuts, dense tables/analytics when appropriate.

- Use CSS grid/flex and breakpoint-based composition rather than separate mobile/desktop pages.
- Use bottom sheets/drawers on mobile and modal/side panels on larger screens for the same interaction.
- Support installable PWA, offline shell, optimistic UI and queued sync for safe offline actions.
- Use responsive charts; never rely on hover-only interactions.
- Support dark mode, system theme, reduced motion and accessible focus states.
- Design for touch first, then add mouse/keyboard enhancements.

8. UI/Visual Design Direction for Claude

Give the UI a calm, modern, premium productivity feel. It should feel closer to a personal dashboard than an enterprise ERP.

- Visual hierarchy: typography and spacing first; cards are supporting containers, not the entire interface.
- Use a restrained neutral base with one configurable accent color.
- Use semantic colors only for meaning: success, warning, error and information.
- Rounded controls can be used, but avoid excessive pill-shaped UI.
- Use compact charts with clear labels and accessible tooltips.
- Keep primary actions obvious; avoid more than one dominant CTA per screen.

- Use skeleton loading, empty states and useful first-run examples.
- Forms should favor smart defaults, recent values and inline editing.

Important: Claude should design the system as a reusable component library first: buttons, inputs, date pickers, amount fields, task rows, habit cells, progress indicators, charts, sheets, dialogs, navigation, command palette and notification patterns.

9. Recommended Development Roadmap

Phase	Scope	Outcome
0 — Foundation	Product architecture, design system, auth, user settings, PWA shell	Step 0: Initial design and reusable UI system/event model.
1 — Core Capture	Tasks, habits, goals, notes, quick add, Today dashboard.	User can manage daily life from one place.
2 — Money	Expenses, income, categories, budgets, recurring items, finance dashboard	Reliable personal finance tracking.
3 — Time	Calendar, events, scheduling, time blocks, planned-vs-actual.	Connect commitments with time.
4 — Wellness	Daily wellness check-ins, activity/sleep/manual metrics, trends.	Lifestyle tracking integrated into Today.
5 — Analytics	Daily/weekly/monthly reviews, cross-module trends, insight engine.	Turn records into understanding.
6 — AI	Natural-language capture, Q&A, planning, reviews, action confirmation	AI becomes the interface layer.
7 — Integrations	External calendar, health platforms, notifications, optional imports.	Reduce manual entry and improve continuity.

10. MVP Scope: What NOT to Build Initially

- Do not build full banking connectivity in the first release.
- Do not build advanced medical/clinical functionality.
- Do not build a complex knowledge graph before search and linking are solid.
- Do not build dozens of analytics charts before the underlying event data is reliable.
- Do not make AI the foundation of every feature; core CRUD flows must work without AI.
- Do not create separate mobile and web applications. Build one responsive PWA.

11. Suggested Technical Architecture

A practical architecture for a modern web/PWA product:

Layer	Recommendation
Frontend	React + TypeScript with a responsive component system; PWA support.
Backend	Django + Django REST Framework (or equivalent typed API architecture).
Database	PostgreSQL as the system of record.
Background jobs	Celery/Redis or equivalent for recurring calculations, notifications and AI jobs.
Search	PostgreSQL full-text initially; introduce Elasticsearch/OpenSearch only when scale/search requirements justify it.
Storage	Object storage for receipts, attachments and exported files.
AI layer	Provider-agnostic service abstraction so models can be changed without rewriting product logic.
Observability	Structured logs, error monitoring, audit events and product analytics with privacy controls.
Deployment	Containerized services; CI/CD with separate development, staging and production environments.

Use an event/activity layer for important user actions. This supports the unified timeline, analytics and AI context without forcing every module to know every other module's internals.

12. Notifications & Reminders

- Task due/overdue reminders.
- Habit reminders based on user-defined schedules.
- Goal review reminders.
- Bills/subscriptions due.
- Calendar event reminders.
- Daily check-in and weekly review.
- AI insights only when actionable; avoid notification spam.
- PWA push notifications where supported, with in-app notification center as fallback.

Notification settings should be granular by module and type, with quiet hours and digest options.

13. Privacy & Security Requirements

- Encrypt data in transit and use strong server-side access controls.
- Use secure authentication, session management and rate limiting.
- Keep financial and wellness data logically separated by permissions and audit access.
- Provide export and deletion controls.
- Clearly distinguish user-entered, imported and AI-generated data.
- AI requests should use only the minimum necessary user context.
- Maintain an immutable audit trail for consequential AI actions and sensitive record changes.

14. AI Assistant — Detailed Product Flow

AI should be available through a persistent command bar / floating action, not only as a separate chat page.

User says	AI behavior
'Spent ₹450 on dinner'	Extract amount/category/date; show preview; save after confirmation or according to a user-configured s
'Remind me to call John tomorrow at 6'	Create reminder/task and confirm time.
'Plan my goal of saving ₹1 lakh in six months'	Calculate target, propose milestones and monthly/weekly actions; user approves before creating.
'How productive was I this week?'	Analyze completed tasks, scheduled time and available activity data; cite the date range and source me
'What did I spend on food last month?'	Return total, category breakdown and comparison with budget if configured.
'I have too much to do today'	Summarize workload and propose rescheduling options; do not silently move commitments.

AI output should always have **context, explanation and action** where appropriate. For any action that changes records, provide a reviewable preview.

15. Life Analytics Framework

Build analytics from a common activity/event stream.

Review	Questions answered
Daily	What happened today? What remains? What needs attention tomorrow?
Weekly	What was completed? Where did time/money go? Which habits/commitments slipped?
Monthly	Spending patterns, goal progress, consistency, time allocation and major trends.
Quarterly	Goal trajectory, recurring behavior patterns, financial direction and personal priorities.

Avoid arbitrary scoring. Use transparent metrics and comparisons such as previous period, target, average and trend.

16. Initial Screen Inventory for UI Design

Area	Initial screens
Global	Login/Signup, onboarding, profile, settings, search/command palette, notifications, Quick Add.
Today	Today dashboard, daily detail, daily review.
Tasks	Inbox, Today, Upcoming, project list, project detail, task detail, focus mode.
Habits	Habit list, habit detail, calendar/history, habit creation/edit.
Goals	Goal list, goal detail, milestone detail, progress/review.
Money	Overview, transactions, expense entry, categories, budgets, recurring payments, subscriptions.
Calendar	Day/week/month, event detail, create event, time-block view.
Wellness	Daily check-in, trends, activity/sleep detail, wellness settings.
Notes	All notes, folders/tags, note editor, journal, backlinks/search.
Insights	Overview, weekly review, monthly review, trends, insight detail.
AI	Assistant, suggested actions, AI history/action log.

17. Definition of Done for V1

- A user can install the app as a PWA and use it comfortably on phone, tablet and desktop.
- A new user can create their first task, habit, goal, expense and note within minutes.
- Today consolidates the user's important information without requiring module hopping.
- Tasks, habits and goals are linked and show meaningful progress.
- Money tracking provides accurate totals and budget status.
- Calendar data can be connected to tasks/time planning.
- Wellness data can be recorded quickly and reviewed over time.
- Notes/journal are searchable and linkable.
- Weekly review explains activity using transparent metrics.
- AI can capture and query data while requiring confirmation for consequential changes.
- Core workflows remain usable when AI is unavailable.
- Responsive behavior is tested at common mobile, tablet and desktop widths.

18. Handoff Brief for Claude UI Design

Use the following as the design brief:

Design a mobile-first Personal Life OS PWA. It must work as one coherent product across phone, tablet and desktop. The primary navigation is Today, Tasks, Goals, Money, Calendar, Wellness, Notes, Insights and AI. The Today screen is the command center. Use progressive disclosure, strong typography, whitespace, accessible touch targets and adaptive layouts. Build a reusable design system and component library before individual screens. Every module must connect through shared entities such as tasks, goals, habits, expenses, events, notes and activity records. The visual language should feel calm, modern and premium, not like an enterprise admin panel. Avoid dashboard clutter and excessive cards. Design Quick Add and AI command entry as first-class interactions. For every screen, specify mobile, tablet and desktop behavior, empty/loading/error states, navigation, primary actions,

validation and accessibility. The output should be implementation-ready with component names, spacing rules, typography scale, responsive breakpoints, interaction states and representative realistic data.

19. Engineering Delivery Strategy

- Start with design system + core data model + authentication + responsive shell.
- Develop one vertical slice end-to-end before building every module: Quick Add → Task → Today → notification → analytics event.
- Use API contracts and reusable domain services.
- Add automated unit/API tests for calculations, recurring schedules, budgets and goal progress.
- Add end-to-end tests for mobile-width and desktop workflows.
- Use feature flags for AI and integrations.
- Instrument product events from the beginning, but avoid collecting unnecessary personal data.
- Run usability tests with real users after each major phase; prioritize friction in capture and Today.

20. Product North Star

The application succeeds when a user can open it at any moment and immediately understand:

- **What do I need to do?**
- **What am I committed to?**
- **How am I spending my time?**
- **How am I spending my money?**
- **Am I keeping up with my habits and goals?**
- **How am I doing overall?**
- **What should I focus on next?**

North-star experience: The user should not feel like they are 'maintaining a productivity database'. The product should quietly collect structured information, surface the important parts at the right time, and help the user make better day-to-day decisions.

Recommended product name/category internally: **Personal Life OS**. The final brand can be decided later.
